

ADMISSION NR: AP4030669

drawn pipes. After recrystallization, the strength of rolled pipes is higher than the strength of drawn pipes and therefore they can be heated to 100 degree higher temperatures. Heat treatment of rolled nonrusting pipes (at 1100-1150C) is higher by 300-400C than the recrystallization level during work and assures full removal of work hardening. Heat treatment of drawn nonrusting pipes (1000-1050C) coincides with recrystallization temperature (950-1050C). To assure full removal of work hardening from drawn pipes, careful observation of metal temperature is required. Orig. art. has: 4 figures, no formulas, no tables.

TITLE: Embrittlement during tempering of chromium-molybdenum-vanadium steels 18

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 3, 1966, 39-44, and  
insert facing p. 49TOPIC TAGS: TEMPERING, MOLYBDENUM STEELS,  
alloy steel, chromium steel, vanadium steel, pearlitic steel, austenite  
steel / 12Kh1MF steel, 15Kh1MF steel

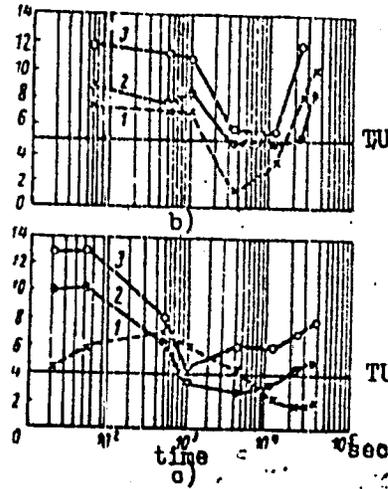

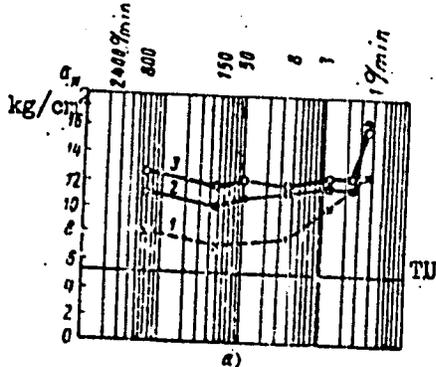

ABSTRACT: The influence of the temperature of austenization, of the cooling rate after austenization, and of tempering temperature on the structure of several specimens of 12Kh1MF and 15Kh1MF steels was studied. The work supplements the results of L. A. Dolinskaya (Stal', 1963, No. 3). The chemical composition (percent carbides), microstructure, and coercive strength of the tempered specimens were determined. The experimental results are presented in graphs and tables (see Fig. 1). It was found that both steels, 12Kh1MF and 15Kh1MF, tend to embrittlement as a result of tempering at 500-700C. It is concluded that the chief cause for the embrittlement in pearlitic steels during tempering is the formation of carbides resulting from the dissociation of intermediate structures.

TITLE: High-frequency pumping systems in parametron digital computers

SOURCE: Avtomaty\*ka, no. 4, 1964, 37-48

TOPIC TAGS: digital computer, parametron, parametron digital computer,  
industrial digital computer

ABSTRACT: A 3-cycle pumping system is considered which permits synthesizing industrial digital computers with parametrons operating at an excitation frequency 4-30 Mc, with 20-30 oscillations per packet (clock frequencies, 100-500 kc). Hard-closed self-synchronizing and ring 3-phase relaxation-oscillator schemes for 3-cycle semiconductor submodulators are described, as well as mixed and purely semiconductor h-f supply schemes which have a pulse-amplitude pumping

**SOURCE:** Avtomatika i priborostroyeniye, no. 4, 1964, 56-59

**TOPIC TAGS:** automatic control, automatic control design, automatic control system, automatic control theory

**ABSTRACT:** In digital systems of automatic industrial-process control, the current value of a process parameter is automatically compared with one or more set points. As existing synchronous comparison devices are too complicated, a new asynchronous device has been developed in which the code of each set point coincides, in the storage unit, with its numerical value. An additional indicant is introduced to identify the next-in-line set point of the same parameter. A functional diagram of the new device is briefly described. A 256-point laboratory

TITLE: Standard Specifications for the Planning of Water Supply Lines on Livestockbreeding Farms (O normakh vodopotrebleniya dlya proyektirovaniya vodoprovodov v zhivotnovodcheskikh khczyaystvakh)

PERIODICAL: Gidrotehnika i melioratsiya, 1958, Nr 9, pp 3 - 10 (USSR)

ABSTRACT: Research conducted since 1955 by the Ukrainskiy nauchno-issledovatel'skiy institut gidrotehniki i melioratsii (Ukrainian Scientific Research Institute of Hydraulic Engineering and Melioration), aims at fixing new norms for water consumption at livestockbreeding farms of the Ukraine, so future water supply lines can be constructed, as near as possible, to the needs of these farms. In the past, these needs were very often overestimated, and the water supply lines were constructed on a larger scale than necessary, which resulted in useless capital investments. As a result of experiments made, the authors established diagrams and

Card 1/2

SOV-99-58-9-1/9  
Standard Specifications for the Planning of Water Supply Lines on Live-  
stockbreeding Farms

tables, the application of which will cut down the water consumption in some of Ukrainian farms from 60 cubic m in 24 hours to 43 cubic m. The reduction of planned water supply lines will result in a reduction of capital expenditures by 12%. There is 1 photo, 6 graphs and 5 tables.

The separation of coal into fractions of different ash contents. Jankow D. (1933).—Pulverized coal is separated into fractions of different ash contents by means of a KCNS coln. of known sp. gr. (1.200). The app. consists of a glass tube 1.4 m. in length and 45 mm. in diam. The lower end is closed by a stopper with an inserted glass stopcock. The pulverized coal is shaken in the tube with the coln. and left for 24 hrs. The coal particles settle according to their sp. gr. and their ash content.

"Using an Antimony Microelectrode for the Potentiometric Chromatography of Gasoline-Alcohol-Water Solutions,"  
Byull, Pol'sk Akad. Nauk, Otd. 3, Vol 1, No 7, pp 297-303, 1953

The antimony electrode can be successfully used for the potentiometric titration of dilute solutions of low acidity of the following non-electrolytes: methyl, n-propyl, n-butyl, and ethyl alcohols and in a mixture of 48% ethyl alcohol, 50% gasoline, and 2% water. When using this mixture, the jump in potential at the equivalence point is especially great. (RZhKhim, No 20, 1954)

TITLE: Some special features of heat transfer in an atomizing jet

SOURCE: Khimicheskoye i neftyanoye mashinostroyeniye, no. 7, 1965, 29-31

TOPIC TAGS: heat transfer, atomizing jet, fuel droplet, heat exchanger

ABSTRACT: Special features of heat transfer in an atomized fuel jet are studied by analyzing the motion of fuel droplets injected at a given angle into a parallel turbulent stream of air. K. N. Yerastov's method (Investigation of the evaporation of fuel jet droplets at high temperatures, v. 2. Moscow, Izd-vo AN SSSR, 1960) is used. A formula is established which permits determination of the volumetric heat transfer coefficient for liquid droplets moving in a counter current gas flow. High experimental values of the heat transfer coefficient obtained in the heat exchanger demonstrate the possibility of increasing the mass transfer coefficient in the mixer and of its application to fast reactions between the

TITLE: Features of the high-temperature drying kinetics of a droplet of a colloidal solution

SOURCE: Inzhenerno-fizicheskiy zhurnal, no. 7, 1964, 33-36

TOPIC TAGS: colloid chemistry, high temperature phenomena, chemical drying, chemical kinetics

ABSTRACT: A study of the kinetics of high-temperature dehydration of a drop of a colloidal solution is described. High-speed photographs and temperature diagrams are given. The temperature range studied was from 100-300°C. It is shown that the drying of droplets of a colloidal solution can be divided into the following phases: a heating phase, a phase of constant drying at wet bulb temperatures, a phase of crust formation, a phase of constant drying at boiling temperature, and a phase of decreasing drying rate at increasing temperatures. The critical moisture content of the material was found to occur when the crust forms of the droplet. Orig. art. has: 1 figure, 3 graphs.

TITLE: On the determination of dispersivity of liquid aerosols

SOURCE: AN UkrSSR. Tcheniya zhidkostey i gazov (Flows of liquids and gases). Kiev, Naukova dumka, 1965, 51-55

TOPIC TAGS: aerosol, streptomycin, adhesive, photoacography/ BF-2 adhesive

ABSTRACT: This paper discusses a method for the measurement of dispersivity, or the determination of the distribution of droplet sizes in liquid aerosols and dusts. In this method, the droplets are caught into an immersion liquid medium, deposited at its bottom on a suitable substrate and are photographed and measured. Requirements for the immersion fluids and for the deposition surfaces are discussed. Materials for the immersion liquid and the deposition bottom surface were selected by tests conducted with the use of cells with glass walls. The arrangement permitted to study the vertical profile of the drops and their contact angles with the deposition surface by a horizontal axis microscope. As finally developed, the deposition surface consisted of adhesive BF-2 applied as a thin film to the surface of a glass plate. This substrate produced drop contact angles close to 180 degrees, for the water solution drops. The immer-

Card 1/2

L 26477-66

ACC NR: AT6008145

sion liquid was Cylinder oil 24. The depth of its layer was 2 - 3 times the drop diameter. The method of investigation consisted of placing the prepared deposition surface coated with a 1 mm layer of the mineral oil into the catching cell equipped with a shutter; exposing the droplets to the experimental environment, photographing them and evaluating their enlarged microphotographs. In the determination of water solutions dispersivity, this methodology permitted determination of the average droplet diameter to a precision of 5%. Photographs of dispersed droplets of an aqueous solution of streptomycin<sup>6</sup> are shown at a 400x magnification. Orig. art. has: 3 figures.

Ignal, I. Ignal's reactor maintenance/repair production; its organization and structure (Utilization of reserves in the Machine Building Industry; Practices of Ignal Plant) [Leningrad] Leningrad, 1977. 226 p. 2,000 copies printed. Tech. Sci. Lit. Division.

OVERVIEW: This collection of articles is intended for workers and technical personnel of the machine-building industry.  
CONTENTS: The book contains principal trends in the utilization of unused production capacity of machine building plants and enterprises to realize these reserves. On the basis of examples drawn from the practice of the leading plants of the USSR, the author shows how to utilize this unused capacity by applying the following measures: improvement of the processability of workpieces; bringing the shape and sizes of blanks closer to the shape and sizes of finished parts; replacement of mechanical machining with cold stamping; use of new methods of cutting; replacement of mechanical processes and stamping with stamping; use of a comprehensive mechanization and automation of the equipment; the possibility of utilizing unused capacity in the construction of heavy machinery in small enterprises. No personalities are mentioned. There are no references. 72.

COVERAGE: The experience of the LMZ (Leningradskiy metallicheskiy zavod - Leningrad Metalworking Plant) in the manufacture of modern large-capacity turbines is presented. Methods for the rationalization of basic manufacturing processes and for the mechanization and automation of manual operations are given. Descriptions of attachments and tools designed by LMZ for improving labor productivity and product quality are provided, and advanced inspection methods discussed. References accompany some articles. No personalities are mentioned. There are 26 references: 25 Soviet and 1 English.

Energy distribution curves of  $\rho$ -mesons produced in  $\pi^+$ -decays have been obtained by assuming that the isotropy of the three  $\pi$ -meson system equals unity and the ratio of probabilities of  $\pi$  and  $\pi^0$  decays is 4. Comparison of the theoretical results with experimental data referring to 492  $\pi^+$ -decay events shows that the most probable values for  $\rho$ -meson spin and parity is the  $0^-$  combination.
